ABOUT DRIVES

Drives, the world leader in manufactured chain products, offers a broad line of superior quality precision roller chains, attachment chains and engineered conveyor chains for the world's toughest applications. Providing the most comprehensive line of quality chain products, Drives delivers leading edge solutions with nearly 60 years of advanced engineering knowledge and experience. Committed to manufacturing world class products, outstanding engineering and manufacturing support and total customer service, Drives utilizes the highest quality materials, technologies, equipment and craftsmanship to produce quality products. Drives manufacturing facilities are located in Illinois, Iowa and Weifang, China.

CHAINS ENGINEERED TO ENHANCE PERFORMANCE

From corrosive environments to heavy shock loads, we engineer the optimum precision roller chain for your application to help increase uptime and reduce maintenance costs. Our entire range of American National Standards Institute (ANSI) standard roller chains, specialty chains and attachment chains meet or exceed ANSI/ASME standard B29.1. Our engineered class chains are manufactured utilizing state-of-the-art equipment. We are ISO 9001: 2015 registered.

Updates are made periodically to this catalog. Visit www.diamonddrives.com for the most current version of the Drives – Chain Products catalog.

HIGH-PERFORMANCE ROLLER CHAIN IN STOCK AND WAITING FOR YOU TO PUT IT TO THE TEST

Drives is a leader in the industry that produces roller chain products for some of the world's toughest industries:

- Oil and Gas
- Forest Products
- Food and Beverage
- Paper
- Packaging
- Mining
- Metal Processing

ROLLER CHAIN FEATURES

WIDE WAIST

The wide-waist design of 60H and larger chains is manufactured with maximized ball heights from special alloy steels for added strength. The wide link plate profile improves stress distribution, leading to improved fatigue resistance and enhanced performance.

SOLID BUSHINGS

Designed for increased wear life.

SOLID ROLLERS

We use solid rollers on all carbon roller chains. The solid roller allows for smooth rotation on the bushing, reducing the impact load as the chain engages the sprocket tooth.

FACTORY PRELOADED AT 50 PERCENT MUTS

Our chain is preloaded to 50 percent of minimum ultimate tensile strength (MUTS), which is especially important for applications involving fixed center-to-center sprockets without take-ups. Applications can withstand shock loads up to 50 percent of the chain's MUTS without premature elongation.

HEAT TREATMENT

Rigorous process controls and state-of-the-art heat-treating furnaces provide consistent quality in all our chain components. This results in optimum toughness and resistance to wear.

PRELUBRICATION

After final assembly, we hot-dip the roller chain in a special lubricant. This process ensures that all the load-bearing surfaces are initially protected from metal-to-metal contact, improving the wear life of the chain.

AUTOMATED ASSEMBLY

Our roller chain assembly methods ensure consistent processes and proper assembly of chain components.

SHOT PEENED PARTS

All precision roller chain rollers and link plates are shot peened for greater fatigue strength.

CONNECTING LINKS

Standard connecting links are used when roller chain is operating under normal conditions. For severe applications, press fit connecting links are suggested. Spring-clip style connecting links are used for sizes 60H and smaller. Sizes 80 – 180H use a special hardened hook cotter. Coated T-pins are used on 200, 264 and 240.

Close style spring clip.

Hook cotter connecting link.

Coated T-pins used on the connecting links.

OFFSET LINKS

Offset links are used when the chain length is an odd number of pitches; however, their fatigue strength is lower than standard chain links. Using offsets should be avoided when possible.

Offset link.

HOW TO USE THIS CATALOG

We designed this catalog to help you find the Drives chain product that is best suited to your specifications.

Drives offers an extensive range of chain and accessories. For your convenience, size ranges are indicated in inches and millimeters. Contact your Drives engineer to learn more about our complete line for the special needs of your application.

This publication contains dimensions, tolerances and load ratings, as well as technical sections for chain selection for both drive and conveyor systems. It provides valuable assistance in the initial consideration of the type and characteristics of chain that may best suit your particular needs.

STORAGE

Drives suggests the following storage guidelines for our chain products:

- Unless directed otherwise by Drives, products should be kept in their original packaging until they are ready to be placed into service.
- Do not remove or alter any labels or stencil markings on the packaging.
- Products should be stored in such a way that the packaging is not pierced, crushed or otherwise damaged.
- The relative humidity should be maintained below 60 percent and the surfaces should be dry.
- The storage area should be kept free from airborne contaminants such as, but not limited to, dust, dirt, harmful vapors, etc.

Due to the fact that Drives is not familiar with your particular storage conditions, we strongly suggest following these guidelines. However, you may be required by circumstances or applicable government requirements to adhere to stricter storage requirements.

When you receive the chain shipment, do not remove products from their packaging until they are ready for use so they do not become corroded or contaminated.

Store the chain in an appropriate atmosphere so they remain protected for the intended period.

WARNING

Failure to observe the following warnings could create a risk of death or serious injury.

- Do not use Diamond-Drives chain products for human lift applications.
- Do not reuse sections from a damaged chain, as the entire chain may be compromised.
- Always follow chain and equipment manufacturer's instructions and plant safety protocols.
- Always follow lock-out/tag-out and power off procedures before installing, removing, lubricating, or servicing a chain system.
- Do not weld to or torch cut nickel-plated chain or Silver Shield CR® plated chain, as welding or torch cutting may release toxic fumes. If chain must be torch cut for removal, use proper ventilation and/or respiratory protective equipment.

CAUTION

Failure to observe the following cautions could create a risk of minor or moderate injury.

- Use only factory subassemblies for assembling chain strands. Do not disassemble and reassemble subassemblies.

NOTICE

- Always follow proper maintenance and handling practices.
- Use proper lubrication for optimal chain life and performance. Refer to Diamond-Drives published recommendations for proper lubricants and methods of lubrication.
- Do not run new chain on worn sprockets, as this will cause the chain to wear more rapidly.
- For best performance, do not mix chain subassemblies from different manufacturers.
- Never weld precision roller chain.

CHAIN SELECTION

HORSEPOWER RATING

The horsepower or kilowatt rating in figs. 1 or 2 on page 11 and 12 are based on the following conditions:

- Chains are operated under ordinary conditions. The ambient temperature range must be between 15° F (-9.5° C) and 140° F (60° C). They should not be used in an atmosphere in which abrasive dust or corrosive gas is present or where the humidity is high.
- Two transmission shafts are in a horizontal position and the chains are properly installed.
- Suggested lubrication system and oil are used.
- Load does not change significantly during transmission. The service factors given in table 3 on page 10 should be taken into account when the chains are used under various operating conditions. The load conditions will affect the life of the chain.
- To estimate the service life of a multiple-strand chain, the multiple-strand factor given in table 1 must be used. When the chain length is 100 pitches and the above conditions are met, a service life of approximately 15,000 hours can be expected.

NOTE

All formulas and table data listed in this catalog are based on Imperial Units. All metric information provided is based on the conversion of that data.

PROCEDURES FOR SELECTING ROLLER CHAIN

1. The following factors must be considered when selecting roller chain:
 - Source of input power.
 - Drive machine type of driven equipment.
 - Horsepower to be transmitted.
 - Revolutions per minute (RPM) of driving and driven shafts.
 - Diameter of driving and driven shafts.
 - Center distance of the shafts.
2. Use table 3 on page 10 to obtain the service factor.
3. Multiply the horsepower or kilowatt value by the service factor to obtain the design horsepower or kilowatt value.
4. Use figs. 1 or 2 on pages 11 and 12 and the horsepower or kilowatt tables to obtain the appropriate chain number of teeth for small sprockets. Refer to the number of revolutions of the high-speed shaft (the driving shaft when the speed is reduced; the driven shaft when the speed is increased) and the design horsepower or kilowatt value. For smoother chain drive, a small pitch chain is suggested. If a single-strand chain does not satisfy the transmission requirements, use a multiple-strand chain. If there are space limitations, a multiple-strand roller chain with a smaller pitch may be used.
5. After determining the number of teeth necessary for the small sprocket, be sure the sprocket diameter satisfies the space limitations.
6. The number of teeth for the large sprocket is determined by multiplying the number of teeth for the small sprocket by the speed ratio. More than 15 teeth on the small sprocket is suggested. The number of teeth for the large sprocket should be less than 120. By reducing the number of teeth for the small sprocket, the number of teeth for the large sprocket can be reduced.

TABLE 1. MULTIPLE-STRAND FACTOR

POWER, CHAIN PULL, TORQUE AND CHAIN LENGTH EQUATIONS

BASIC FORMULA FOR CHAIN DRIVE

Inch

$$H = \frac{P \times S}{33,000} \quad H = \frac{T_{ft} \times n}{5,252} \quad H = \frac{T_{in} \times n}{63,025}$$

$$P = \frac{H \times 33,000}{S} \quad P = \frac{H \times 396,000}{C \times N_s \times n} \quad P = \frac{H \times 126,050}{D \times n} \quad P = \frac{T_{ft} \times 24}{D} \quad P = \frac{T_{in} \times 2}{D}$$

$$T_{ft} = \frac{H \times 5,252}{n} \quad T_{in} = \frac{H \times 63,025}{n}$$

$$S = \frac{C \times N_s \times n}{12}$$

Metric

$$H_M = \frac{P_M \times S_M}{60} \quad H_M = \frac{T_{M,n} \times n}{9,544}$$

$$P_M = \frac{H_M \times 60}{S_M} \quad P_M = \frac{H_M \times 60,000}{C_M \times N_s \times n} \quad P_M = \frac{H_M \times 19,088}{D_M \times n} \quad P_M = \frac{T_{M,m} \times 2000}{D_M}$$

$$T_{Mm} = \frac{H_M \times 9,544}{n} \quad T_{M,mm} = \frac{H_M \times 9,544}{n}$$

$$S_M = \frac{C_M \times N_s \times n}{1000}$$

Inch & Metric

$$L = \frac{N_s + N_L}{2} + (2 \times C_D) + \frac{((N_L - N_s)/6.28)^2}{C_D}$$

(**)Any fraction of L is counted as one pitch

(***)Subscript M denotes metric units.

TABLE 2. NOMENCLATURE KEY

Nomenclature	Units	Description
H	[HP, kW]	Power
P	[lb, kN]	Chain Pull
S	[ft/min, m/min]	Chain Speed
T _{ft}	[ft-lb, m-kN]	Torque
T _{in}	[in-lb, mm-kN]	Torque
n	[rpm]	Sprocket Speed
C	[in, mm]	Chain Pitch
D	[in, mm]	Small Sprocket Pitch Diameter
C ₀	[pitches]	Center Distance Between Sprockets
L	[pitches]	Total Chain Length
N _s		Small Sprocket No. of Teeth
N _L		Large Sprocket No. of Teeth

TABLE 3. SERVICE FACTORS FOR ROLLER CHAIN DRIVES

Types of Driven Load	Load Classifications	Type of Input Power		
		Internal Combustion Engine with Hydraulic Drive	Electric Drive Motor	Internal Combustion Engine with Mechanical Drive
Smooth Load	Agitators – Pure liquid	1.0	1.0	1.2
	Conveyors – Uniformly loaded or fed (apron, assembly, belt, flight, oven, screw)			
	Fans – Centrifugal and light, small diameter			
	Machines – All types with uniform, non-reversing loads			
Moderate Shock	Clay-Working Machinery – Pug mills	1.2	1.3	1.4
	Conveyors – Heavy duty and NOT uniformly loaded (apron, assembly, belt, flight, oven, screw)			
	Food Industry – Beet slicers, dough mixers, meat grinders			
	Grinding Machine – All types with moderate shock and non-reversing loads			
	Textile Industry – Calendars, dyeing machinery, mangles, nappers, soapers, spinners, tenter frames			
Heavy Shock	Clay-Working Machinery – Brick press, briquetting machinery	1.4	1.5	1.7
	Conveyors – Reciprocating and shaker			
	Hammer Mills			
	Machine Tools – Punch press, shears, plate planers			
	Mills (Rotary Type) – Ball, cement kilns, rod mills, tumbling mills			
	Textile Industry – Carding machinery			

SELECTION OF CHAIN AND SMALL SPROCKET

CHAIN PITCH

The smallest applicable pitch is desirable for quiet operation and high speed.

NUMBER OF SPROCKET TEETH

For a given chain pitch and shaft to transmit a given horsepower, the effect of increasing the number of teeth in the sprocket is to increase the chain linear speed and decrease the chain pull proportionally. This results in a decrease of the chordal action, which results in a quiet drive with less impact.

Usually, large sprockets should not exceed 120 teeth although many successful drives use sprockets with 150 teeth and more.

SELECTION OF LARGE SPROCKET

After the small sprocket has been selected, the number of teeth in the large sprocket is determined by the specified ratio of the shaft speeds.

HORSEPOWER VS. RPM TABLE

NOTE: The maximum horsepower rating specified in each of the strand columns is not limiting for chain drives. Consult your Drives representative on those applications that are above the horsepower range of the chart.

NOTE: All measures are based on imperial measurements. Metric measurements are conversions.

Fig. 1. Roller chain pitch selection.

KILOWATT VS. RPM TABLE

NOTE: The maximum horsepower rating specified in each of the strand columns is not limiting for chain drives. Consult your Drives representative on those applications that are above the horsepower range of the chart.

NOTE: All measures are based on imperial measurements. Metric measurements are conversions.

Fig. 2. Roller chain pitch selection.

DRIVE SELECTION PROCEDURE

Selection Example (1)

Question 1: A conveyor with 50 HP (40 kW) is driven by a 100 RPM electric motor. How should you select the chain and sprockets?

Answer:

1. Seek the service factor, 1.0, from table 3 on page 10.

$$\text{Power to be transmitted} \times \text{service factor} = \text{design horsepower}$$

$$50 \text{ HP} \times 1.0 = 50 \text{ HP} \quad 37.3 \text{ kW} \times 1.0 = 37.3 \text{ kW}$$

2. Refer to figs. 1 or 2 on pages 11 and 12 for 100 RPM 50 HP (40 kW) and 160 chain with sprocket 18T to 22T is obtained.
3. Check horsepower (kilowatt) tables for chain 160, and as you see, the horsepower ratings of 160-19T with speed of 100 RPM is 50.48 HP (37.64 kW), which is satisfactory.
4. The following are selected:

Chain no. 160 small sprocket 160-19T.

Selection Example (2)

Question 2: The number of revolutions for a drive is 500 RPM and the power to be transmitted is 13 HP (9.69 kW). The RPM is reduced to 125 (1/4). The center distance should be 11.00 in. (279.4 mm) with a space limitation of 19.00 in. (482.6 mm), and a uniform load. How should you select the chain and sprocket for this application?

Answer:

1. Design horsepower (kilowatt) is computed as follows:

$$\text{Design horsepower: } 13 \text{ HP} \times 1.0 = 13 \text{ HP}$$

$$\text{Design kilowatt: } 9.69 \text{ kW} \times 1.0 = 9.69 \text{ kW}$$

2. Select the chain and the number of teeth for the sprocket by referring to figs. 1 or 2 on pages 11 and 12.
60-18T has been selected.

3. Speed reduction ratio is $0.25 = \frac{125 \text{ RPM}}{500 \text{ RPM}}$

Therefore, the number of teeth in the large sprocket is

$$72T = \frac{18T}{0.25}$$

4. The outside diameter of the 18T is 4.685 in. (119 mm) and the 72T is 17.60 in. (447.04 mm).

The space required for this arrangement is:

$$\frac{4.685 \text{ in.} + 17.60 \text{ in.}}{2} + 11 \text{ in.} = 22.14 \text{ in.}$$

$$\frac{119 \text{ mm} + 447.04 \text{ mm}}{2} + 279.4 \text{ mm} = 562.42 \text{ mm}$$

which can not be contained in the 19 in. (482.6 mm).

5. Multiple-strand chain is selected. 50-2 16T to 20T is selected using fig. 1. (fig. 2.).

$$\frac{10 \text{ HP} \times 1.0}{1.7} = 5.88 \text{ HP}$$

$$\frac{7.46 \text{ kW} \times 1.0}{1.7} = 4.39 \text{ kW}$$

(1.7 is multiple strand factor)

Refer to the horsepower tables. 50-2, 18T is obtained. Its outside diameter is 3.90 in. (99.1 mm). The large sprocket is:

$$72T = \frac{18T}{0.25} \text{ outside diameter } 14.69 \text{ in. (373.13 mm)}$$

However, this selection cannot be contained in the space.

6. Triple-strand chain is selected in the same manner as above 50-3, 13T and 52T are obtained. The outside diameter of sprockets is 2.87 in. (72.99 mm), and 10.67 in. (271.02 mm) respectively.

$$\frac{2.87 \text{ in.} + 10.67 \text{ in.}}{2} + 11 \text{ in.} = 17.77 \text{ in.}$$

$$\frac{72.99 \text{ mm} + 271.02 \text{ mm}}{2} + 279.4 \text{ mm} = 451.41 \text{ mm}$$

can be contained in the space required.

The chain and sprockets selected are 50-3, 13T and 52T.

SLOW SPEED CALCULATION

When the chain speed (S) is less than 160 ft/min, select a roller chain size smaller than the chain chosen from the horsepower rating method mentioned above.

Estimate chain size: If horsepower is not known use the following formulas to determine HP:

$$H = \frac{P \times S}{33,000}$$

$$H_M = \frac{P_M \times S_{Mm}}{60}$$

$$H = \frac{T_{ft} \times n}{5,252}$$

$$H_M = \frac{T_{Mm} \times n}{9,544}$$

$$H = \frac{T_{in} \times n}{63,025}$$

$$H_M = \frac{T_{Mmm} \times n}{9,544}$$

Once the HP is known, use figs. 1 or 2 on pages 11 and 12 to estimate the chain size. If the RPM is less than 10 RPM than use 10 RPM as starting point.

If the chain pull is not known directly, please use one of the basic equations shown.

$$P = \frac{H \times 33,000}{S}$$

$$P_M = \frac{H_M \times 60}{S_M}$$

$$P = \frac{H \times 396,000}{C \times N_s \times n}$$

$$P_M = \frac{H_M \times 60,000}{C_M \times N_s \times n}$$

$$P = \frac{H \times 126,050}{D \times n}$$

$$P_M = \frac{H_M \times 19,088}{D_M \times n}$$

$$P = \frac{T_{ft} \times 24}{D}$$

$$P_M = \frac{T_{Mm} \times 2,000}{D_M}$$

$$P = \frac{T_{in} \times 2}{D}$$

Chain Selection Process

- Calculate Chain Pull (P_c) using one of the following formulas.
- Calculate the chain speed (S)

$$S = \frac{C \times N_s \times n}{12}$$
- Adjust the P_c chain for speed

TABLE 4. CHAIN SPEED

Chain speed	Speed Coefficient
Less than 50 ft./min. (15.24 M/min.)	1.0
51 to 100 ft./min. (15.54 to 30.48 M/min.)	1.2
101 to 160 ft./min. (30.78 to 48.77 M/min.)	1.4

- Compare the adjusted P_c to the average tensile strength of the selected chain by multiplying the adjusted chain pull by 8.

$$P_c \times 8 \leq \text{ATS (Average Tensile Strength)}$$

Example:

- Given: RPM = 10
Torque = 7,000 in-lbs (0.791 M-kN)
Maximum sprocket diameter = 10 inches (254 mm)

- Calculations:

$$H = \frac{T_{in} \times n}{63,025} \quad H = \frac{7,000 \times 10}{63,025} \quad H = 1.11 \text{HP}$$

$$H_M = \frac{T_{mm} \times n}{9,544} \quad H_M = \frac{0.791 \times 10}{9,544} \quad H_M = 0.83 \text{kW}$$

- Based on the horsepower, the estimated chain selection should be an 80 chain.
- Based on maximum sprocket diameter of 10 inches (254 mm) use table 28 on pages 28 through 30 or table 51 on pages 43 through 45 and select a 30 tooth sprocket which has a pitch diameter of 9.567 inches (243 mm).
- Calculate chain pull

$$P = \frac{T_{in} \times 2}{D} \quad P = \frac{7,000 \times 2}{9.567} \quad P = 1,463 \text{ lb}$$

$$P_M = \frac{T_{mm} \times 2,000}{D} \quad P_M = \frac{0.791 \times 2,000}{243} \quad P_M = 6.51 \text{ kN}$$

- Calculate chain speed

$$S = \frac{C \times N_s \times n}{12} \quad S = \frac{1 \times 30 \times 10}{12} \quad S = 25 \text{ feet per minute}$$

$$S_M = \frac{C_M \times N_s \times n}{1,000} \quad S_M = \frac{25.1 \times 30 \times 10}{1,000} \quad S_M = 7.53 \text{ meters per minute}$$

- Adjust chain pull for speed adjustment:

$$P_c = \text{Speed coefficient} \times P$$

$$P_c = 1 \times 1,463 \quad P_c = 1,463$$

$$P_{Mc} = 1 \times 7.53 \text{ M/min.} \quad P_{Mc} = 7.53 \text{ M/min.}$$

- Compare against average tensile strength of the chain:

$$P_c \times 8 \leq \text{ATS (Average Tensile Strength)}$$

$$1,463 \times 8 \leq 14,500 \text{ lb} \quad 11,704 \leq 14,500 \text{ lb}$$

$$P_{Mc} = 7.53 \times 8 \leq 64.5 \text{ kN} \quad P_{Mc} = 60.24 \leq 64.5 \text{ kN}$$

- 80-1 chain with a 30 tooth sprocket is a selection.

SELECTION OF HIGH TEMPERATURES

Our chains are made from heat-treated carbon steel. When exposed to high temperatures, the mechanical properties of the heat-treated chain components are impaired.

1. The hardness and, therefore, the wear resistance of pins and bushings is reduced.
2. At temperatures above 390° F (199° C), the rollers and plates may lose some of their hardness and strength.

Standard roller chain can be used up to 500° F (260° C) with the adjustments shown in table 5.

TABLE 5. TEMPERATURE EFFECT ON CHAIN

Temperature	Percentage of Catalog Capacity Rating
Up to 340° F (171° C)	100 percent
390° F (199° C)	75 percent
500 ° F (260° C)	50 percent

	Type I Manual or Drip Lubrication			Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication																								

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubrication				Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication													

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

TABLE 10. 60 – 0.750 INCH PITCH HORSEPOWER

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

TABLE 11. 80 – 1.000 INCH PITCH HORSEPOWER

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubrication				Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication													

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubrication				Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication													

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubrication				Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication											

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

TABLE 19. HORSEPOWER RATINGS – SINGLE STRAND ROLLER CHAIN NO. 60H

TABLE 19. HORSEPOWER RATINGS – SINGLE STRAND ROLLER CHAIN NO. 60H

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

TABLE 20. HORSEPOWER RATINGS – SINGLE STRAND ROLLER CHAIN NO. 80H

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubrication				Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication											

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubrication			Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication																											

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubrication				Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication											

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubri- cation				Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication															

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubrication					Type II Bath or Disc Lubrication										Type III Oil Stream Lubrication															

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubrication				Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication											

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubrication				Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication											

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubrication				Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication															

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubrication				Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication														

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

	Type I Manual or Drip Lubrication				Type II Bath or Disc Lubrication								Type III Oil Stream Lubrication							

NOTE: The limiting RPM for each lubrication type is shown in the chart's shaded areas directly above the type I, II or III reference. For optimum results, it is suggested that the roller chain manufacturer be given the opportunity to evaluate the operating condition of chains in the shaded (galling range) speed area. The horsepower ratings of multiple-strand chains are greater than those for single strand chain. See table 1 on page 8 for multiple-strand factors.

CORROSION RESISTANT CHAIN PRODUCT SELECTION GUIDE

STAINLESS STEEL MATERIAL SELECTION

304 PS SERIES STAINLESS STEEL CHAIN

The primary use of 304 PS series stainless steel chain is in corrosive and/or high-temperature environments, which shortens the life of standard carbon steel roller chain. The 304 PS series stainless steel chain gives excellent resistance to corrosion and high temperatures. 304 PS series stainless steel is generally considered non-magnetic.

316 NS SERIES STAINLESS STEEL CHAIN

The primary use of 316 NS series stainless steel chain is in highly corrosive and/or extreme temperatures, which shorten the life of 304 PS series stainless steel chain.

TABLE 53. MATERIALS OF COMPONENT PARTS

Abbrev.	Material	Link Plate	Pin	Bushing	Roller
PS	304 Series	AISI 304	AISI 304	AISI 304	AISI 304
NS	316 Series	AISI 316	AISI 316	AISI 316	AISI 316
AS	600 Series	AISI 300	600 PH ⁽¹⁾	600 PH ⁽¹⁾	600 PH ⁽¹⁾

⁽¹⁾PH: precipitation hardened.

600 AS SERIES STAINLESS STEEL CHAIN

The primary use of 600 AS series stainless steel chain is in corrosive and/or high-temperature environments, which shortens the life of standard carbon steel chain. The 600 AS series stainless steel chain has less corrosion resistance than 304 PS series stainless steel, but the hardened round parts are designed to provide for better wear life than 304 PS series stainless steel chain.

TABLE 52. PERFORMANCE OF ANTI-CORROSIVE CHAINS

Abbrev.	Chain	Corrosion Resistance	Temperature Resistance	Magnetism	Wear Resistance
NP	NP Chain	Acceptable for outdoor and decorative applications	14° F - 140° F (-10° C - 60° C) (Never use below -4° F or above 300° F)	Magnetic	Excellent
CR	Silver Shield CR®	Acceptable for wet outdoor environments including seawater	14° F - 140° F (-10° C - 60° C) (Never use below -4° F or above 300° F)	Magnetic	Excellent
AS	600 Series	Good for general acid, alkali and water	-40° F ~ 750° F ⁽¹⁾ (-40° C - 400° C) [Never use above 930° F (500° C)]	Magnetic	Very Good
PS	304 Series	Good for general acid, alkali and water	-40° F ~ 750° F ⁽¹⁾ (-40° C - 400° C) [Never use below -270° F (-150° C) or above 1300° F (700° C)]	Non-magnetic	Fair
NS	316 Series	Superior to the other stainless material	-40° F ~ 750° F ⁽¹⁾ (-40° C - 400° C) [Never use below -270° F (-150° C) or above 1500° F (815° C)]	Non-magnetic	Fair

⁽¹⁾Contact your Drives representative for temperatures below -20° F (29° C) or above 500° F (260° C).

CHAIN SELECTION

General selection is based on bearing pressure between the pin and bushing. Anti-corrosive roller chains are normally intended to be used at slow speed without lubrication. Chain selection should be made based on the bearing pressure, as shown below.

TABLE 54. ALLOWABLE BEARING PRESSURE

Chain	Max. Allowable Bearing Pressure Between Pin and Bushing	Maximum Operating Speed
304 and 316 Chain	1,420 psi (9.79 N/mm ²)	230 ft./min. (70 m/min.)
600 Chain	2,130 psi (14.68 N/mm ²)	230 ft./min. (70 m/min.)

The chain's maximum allowable load can be obtained by the formula:

$$\text{Maximum allowable load} = \text{Maximum allowable bearing pressure} \times \text{Bearing area between pin and bushing}$$

TABLE 55. SERVICE FACTOR

Type of Impact	Service Factor
Smooth transmission	1.0
Transmission with some impact	1.3
Transmission with large impact	1.5

TABLE 56. SPEED COEFFICIENT

Chain Speed	Speed Coefficient
0 ~ 50 ft./min. (0 - 15 m/min.)	1.0
50 ~ 100 ft./min. (15 - 30 m/min.)	1.2
100 ~ 160 ft./min. (30 - 49 m/min.)	1.4
160 ~ 230 ft./min. (49 - 70 m/min.)	1.6

TABLE 57. MAXIMUM ALLOWABLE LOAD

Chain No.	304SS (PS) and 316SS (NS)	600SS (AS)
	lbs. kN	lbs. kN
40	100 0.44	155 0.69
50	165 0.73	230 1.02
60	231 1.03	350 1.56
80	396 1.76	600 2.67
100	568 2.53	850 3.78
120	850 3.78	1278 5.68
140	1005 4.47	1535 6.83
160	1400 6.23	2100 9.34
C2040	100 0.44	155 0.69
C2050	165 0.73	230 1.02
C2060H	250 1.11	375 1.67
C2080H	415 1.85	625 2.78
C2100H	600 2.67	900 4.00
C2120H	895 3.98	1340 5.96
C2160H	1450 6.45	2170 9.65

TABLE 58. TEMPERATURE FACTOR

Temperature	304 Series	316 Series	600 Series
~ -270° F (-168° C)	X	X	X
-270° F ~ -40° F (-168° C - -40° C)	1.0	1.0	X
-40° F ~ 750° F (-40° C - 400° C)	1.0	1.0	1.0
750° F ~ 930° F (400° C - 500° C)	1.2	1.0	1.8
930° F ~ 1,100° F (500° C - 593° C)	1.5	1.2	X
1,100° F ~ 1,300° F (593° C - 704° C)	1.8	1.5	X
1,300° F ~ 1,500° F (704° C - 815° C)	X	2.0	X
1,500° F ~ (815° C)	X	X	X

X = Not suggested.

Chain selection can be made using the following formula:

$$\boxed{\text{Maximum Chain Tension}} \times \boxed{\text{Service Factor}} \times \boxed{\text{Speed Coefficient}} \times \boxed{\text{Temperature Factor}} \leq \boxed{\text{Maximum Allowable Load}}$$

Maximum allowable load or maximum bearing pressure as shown above can be doubled only when the chain is used in group A of the Corrosion Resistance Guide on page 48 and properly lubricated.

CONVEYOR CHAIN SELECTION GUIDE STEPS

The ANSI single- and double-pitch roller chain is widely used for conveyor service.

The following procedure is useful for economical and quick chain selection.

STEP 1: Confirm the operating conditions of the conveyor.

STEP 2: Tentatively select the chain size.

STEP 3: Calculate the design chain tension (actual chain tension).

STEP 4: Calculate the required power.

STEP 5: Verify the chain load.

STEP 6: Verify the allowable roller load.

STEP 1: CONFIRM THE OPERATING CONDITIONS OF THE CONVEYOR

The following information is needed to design a chain conveyor.

- Type of conveyor (slat conveyor, bucket elevator, etc.).
- Method of chain travel (horizontal, inclined or vertical conveyor).
- Type, weight and size of materials to be conveyed.
- Weight of materials to be transported per foot of conveyor length.
- Conveyor speed.
- Conveyor length.
- Lubrication.
- Considerations for special environments.

STEP 2: TENTATIVELY SELECT THE CHAIN SIZE

To tentatively select the chain size, estimate the chain tension (P) by the following formula. A chain with an allowable load equal to or over the below calculated chain tension may be tentatively selected.

$$P \text{ (lbs.)} = M_T \times f \times k_1 \quad P_M \text{ (kN)} = \frac{9.81 \times M_{MT} \times f \times k_1}{1,000}$$

Where:

P = Chain pull (lbs., kN)

M_T = Total weight of material conveyed (lbs. or Kg)

f = Coefficient of friction, sliding and/or rolling
($F_R f_s$ tables 60, 61, 62 and 63 on page 51)

k_1 = Chain speed coefficient (table 65 on page 52)

USE CHAIN ENGINEER™ TO SELECT YOUR CHAIN

www.chain-engineer.com

- Select the correct product for your chain drive or conveyor.

TABLE 60. CHAIN AND ROLLER FEATURES THAT MAY HELP IN SELECTION

Oversize R Roller Type	
Chain Rolling (Horizontal or Vertical)	
	• Heavy in chain weight • Greater allowable roller load • Less roller wear • Smooth operation • Less vibration • Lower friction and less power required • Generally used for: • Conveyor lengths more than 35 ft. (11 m). • Conveyor speeds more than 70 ft. min. (21 m/m).
Standard S Roller Type	
Chain Rolling	Chain Sliding (Double-Pitch Chain)
	
• Lightweight • Lower allowable roller load	
• Generally used for: • Conveyor lengths more than 35 ft. (11 m). • Conveyor speeds more than 70 ft./min. (21 m/m).	• Suitable for impact and dirty conditions • Economical • Impact resistant • Greater power required

STEP 3: CALCULATE DESIGN CHAIN TENSION

Next, the chain tension should be calculated using the actual weight of the conveyor chain and material conveyed. Use the below formulas or the free Chain Engineer™ mobile web app to calculate this information: www.chain-engineer.com.

CONVEYOR CHAIN PULL FORMULAS

Horizontal

Material is fully supported by the chain

- Inch: $P = (2.1W + M)f_M C$
- Metric: $P = (2.1W + M)f_M C / 1,000$

Material is moved but not supported by the chain

- Inch: $P = [(2.1Wf_M + Mf_w) C + J]$
- Metric: $P = [(2.1Wf_M + Mf_w) C + J] / 1,000$

Fig. 3. Horizontal - return side supported illustration.

Vertical

- Inch: $P = (W + M)C + T$
- Metric: $P = [(W + M)C + T] / 1,000$

Fig. 4. Vertical.

Inclined

Material is fully supported by the chain

- Inch: $P = (2.1W + M)f_M \cos\alpha C + (C M \sin\alpha) + J$
- Metric: $P = [(2.1W + M)f_M \cos\alpha C + (C M \sin\alpha) + J] / 1,000$

Note: When $(Wf_r \cos\alpha - W \sin\alpha) C$ is positive, multiply quantity by 1.1 to account for tail shaft friction.

Material is moved but not supported by the chain

- Inch: $P = [(f_M W + f_w M) \cos\alpha + (W + M) \sin\alpha] C + (W f_M \cos\alpha - W \sin\alpha) C + J$
- Metric: $P = \{[(f_M W + f_w M) \cos\alpha + (W + M) \sin\alpha] C + (W f_M \cos\alpha - W \sin\alpha) C + J\} / 1,000$

Additional chain pull material sliding against sideboards

- Inch & Metric: $J = Ch^2/R$

Fig. 5. Inclined - return side supported illustration.

Where:

- P = Total conveyor pull (lbs, kN)
- W = Weight of chain, attachment, slats, etc. per foot or meter (lbs/ft, kg/m)
- M = Weight of material per foot or meter on the conveyor (lbs/ft, kg/m)
- f_M = Friction coefficient for chain (it may be either f_r or f_s whichever applies)
- f_w = Friction coefficient for material sliding
- f_r = Friction coefficient of chain rolling
- f_s = Friction coefficient of chain sliding on supports
- C = Length of conveyor (ft, m)
- T = Take-up force (lbs, kg)
- J = Additional chain pull (lbs, kg)
- h = Height of material (in, cm)
- R = Variable factor for different materials

TABLE 61. COEFFICIENT OF ROLLING FRICTION (f_R)

Type of Roller	Dry	Lubricated
Oversized Roller	0.12	0.08
Standard Roller	0.21	0.14

Where: $f_R = f_s \frac{d_a}{d_r}$

d_a = bushing outside diameter

d_r = roller outside diameter

TABLE 62. METAL ROLLERS

	Dry	Lubricated
Cast Rollers	0.5	0.4
Steel Rollers	0.4	0.3

TABLE 63. COEFFICIENT OF SLIDING FRICTION (f_s)

Material	Coefficient	
	Dry	Lubricated
Steel on steel	0.33	0.20
Cast iron or cast steel on same surface	0.50	0.40
Steel on bronze	—	0.15
Steel on hardwood	0.35	0.25
Cast iron or cast steel on hardwood	0.44	—

TABLE 64. COEFFICIENT OF SLIDING FRICTION OF CONVEYED MATERIAL (f_s)

Material	Coefficient	
	Dry	Lubricated
Coal on steel	0.55	—
Crushed stone or sand on steel	0.70	—
Cement on steel	0.80	—
Wood on wood	0.55	—
Corn on steel	0.30	—
Soybeans on steel	0.41	—
Oats on steel	0.35	—
Wheat on steel	0.43	—
Salt on steel	0.70	—

TABLE 65. R FACTOR VALUES

Material	"R" Imperial	"R" Metric
Coal	14.0	60.7
Coke	35.0	151.7
Limestone	7.5	32.5
Gravel	7.0	30.3
Sand	5.5	23.8
Ashes	35	151.7

Additional pull on conveyor (J) material sliding against sideboards

$$J = Ch^2/R$$

Where:

h = Height of material in inches

R = Variable factor for different materials
(see table 65)

C = Length of conveyor in feet

Fig. 6. Cross-section of material conveyed in a trough.

STEP 4: CALCULATE THE REQUIRED POWER

Calculate the required power to drive the conveyor from the following formula.

HORIZONTAL AND/OR INCLINED CONVEYOR

$$H = \frac{P \times S}{33,000} \quad H_M = \frac{P_M \times S_M}{60}$$

VERTICAL CONVEYOR

$$H = \frac{M \times C \times S}{33,000} \quad H_M = \frac{M_M \times C_M \times S_M}{60}$$

$$\text{Where: } S = \frac{C \times N_s \times n}{12} \text{ (ft./min.)} \quad S_M = \frac{C_M \times N_s \times n}{1,000} \text{ (M/min.)}$$

H = Horsepower

S = Chain speed (ft./min., M/min.)

M = Material weight (lbs./ft., kg/M)

C = Sprocket center distance (in., mm)

n = Small sprocket speed (RPM)

N_s = Number of teeth – small sprocket

C = Chain pitch (in., mm)

P = Chain pull (lbs., kN)

STEP 5: VERIFY THE CHAIN

Multiply the chain tension (P) by the chain speed coefficient (k_i) listed in table 65, and verify the following formula.

$$P \times k_i \leq \text{Max. allowable load of the chain}$$

When the design chain tension (P x k_i) is over the allowable load or much less than it, try the same steps again for the next bigger or smaller chain size to select a more suitable chain.

TABLE 66. CHAIN SPEED COEFFICIENT (k_i)

Chain Speed ft./min. (m/min.)	Speed Factor (k _i)
0 ~ 50 (0 - 15)	1.0
50 ~ 100 (15 - 30)	1.2
100 ~ 160 (30 - 50)	1.4
160 ~ 230 (50 - 70)	1.6
230 ~ 300 (70 - 90)	2.2
300 ~ 360 (90 - 110)	2.8
360 ~ 400 (110 - 120)	3.2

STEP 6: VERIFY THE ALLOWABLE ROLLER LOAD

When the load is carried on the rollers, the total weight of the chain and load per roller should not exceed the allowable roller load shown in table 67.

**TABLE 67. ALLOWABLE ROLLER LOAD
[LBS./ROLLER (KG/ROLLER), CARBON STEEL ONLY]**

Chain	Size	Large Roller	Standard Roller
C2040	40	143 (65)	33 (15)
C2050	50	220 (100)	44 (20)
C2060H	60	350 (160)	66 (30)
C2080H	80	590 (268)	120 (54)
C2100H	100	880 (400)	180 (82)
C2120H	120	1320 (600)	260 (118)
C2160H	160	2160 (980)	430 (195)

NOTE: Large rollers are available only for double-pitch roller chain.

POINTS TO CONSIDER

- For long conveyors, use take-up devices to eliminate chain slack.

$$\text{Take-up stroke} = \frac{(\text{center distance between sprockets} \times 0.02)}{\text{catenary sag allowance}}$$

- Chain must always be engaged with at least three sprocket teeth.
- When two or more strands of conveyor chain operate together, all the sprocket teeth on the head shaft should be aligned. The chain may be matched at the factory for uniform length and attachment alignment for accurate multiple-strand operation.

MATCHING AND TAGGING OF CHAINS

Class 1 – Measure, Match & Tag

All chain strands⁽¹⁾ are assembled as multiple sections of 10 feet (3.05 m) or less⁽²⁾, measured, and tagged with that measurement. These sections are arranged to incorporate a parallel and consecutive match.

- **Parallel:** The sections are assembled such that sections directly across from each other have a difference of less than 0.030 in (0.76 mm).
- **Consecutive:** The chains are arranged such that a “short” section is not directly assembled to a “long” section. This results in having a difference between matched strands (for any given total lengths) of less than 0.030 in (0.76 mm).

Note: Strands⁽¹⁾ less than 5 feet (1.52 m) will be matched to 0.006 in/ft (0.50 mm/m).

Class 2 – Measure, Match & Tag (Premium)

All chain strands⁽¹⁾ are assembled as multiple sections of 10 feet (3.05 m) or less⁽²⁾, measured, and tagged with that measurement. These sections are arranged to incorporate a parallel and consecutive match.

- **Parallel:** The sections are arranged such that sections directly across from each other have a difference of less than 0.020 in (0.51 mm).
- **Consecutive:** The chains are arranged such that a “short” section is not directly assembled to a “long” section. This results in having a difference between matched strands (for any given total lengths) of less than 0.020 in (0.51 mm).

Notes:

1) Strands⁽¹⁾ less than 10 feet (3.05 m) will be matched to 0.002 in/ft (0.17 mm/m).

2) Customer specified match over and above what is specified in this document will be classified as Class 2.

All matched/tagged chains are within ANSI standard length tolerances. Matching measured sections (10 feet (3.05 m) or shorter sections) ensures that attachments are aligned across the parallel chain stands. This optimized match also results in parallel strand lengths being extremely close to one another.

All matched/tagged chains are built using special procedures to select or make the parts and assemble the chain to ensure the least amount of variance between strands. Reference to “short” or “long” sections simply refers to the minimum and maximum side of that particular batch length range.

⁽¹⁾ Strand: total chain length

⁽²⁾ Section: part of the total chain length – 10 ft (3.05 m) long or less

Fig. 7. Matching and tagging of chains.

INSTALLATION AND MAINTENANCE

SPEED RATIO AND CHAIN WRAP

The speed ratio of roller chain can range up to 7:1 under normal operating conditions. However, a speed ratio of 10:1 is possible if the speed is very slow. Chain wrap on the small sprocket must be at least 120 degrees.

DISTANCE BETWEEN SHAFTS

Sprockets can be separated by any distance as long as their teeth do not touch. Optimum distance is 30 to 50 times the pitch of the chain being used, except when there is a pulsating load. In such cases, the distance should be up to 20 times the pitch of the chain used.

POSITION

Roller chain is ideally installed in a horizontal position. If the chain drive must be in a vertical position, the wear life of the chain will likely be reduced because of the effect of gravity.

SLACK

Generally, the slack of a roller chain should be on the lower side (see fig. 8). Adequate slack (SS) is about 4 percent of the span for normal drives. In the following cases, the slack should be about 2 percent of the span:

- Vertical drive or close to vertical drive.
- Center distance between two shafts is greater than 3 ft.
- Chain is operated under heavy load and high frequency of on and off drive.
- Direction of the drive is often changed.

Fig. 8. Chain tension.

POSITION OF SPROCKET

The two shafts should be parallel and preferably in a horizontal position. Sprockets should be firmly installed. See figs. 9 and 10.

Use a straight edge to check that the two sprockets are installed along the same horizontal plane.

Fig. 9.
Aligning shaft.

Fig. 10.
Aligning sprockets.

TABLE 68. SUGGESTED POSSIBLE MID-SPAN MOVEMENT

Drive Center-Line	Tangent Length Between Sprockets in in. (cm)					
	10 (25)	20 (51)	30 (76)	50 (127)	70 (178)	100 (254)
	in. (mm)	in. (mm)	in. (mm)	in. (mm)	in. (mm)	in. (mm)
Horizontal to 45°	0.4-0.6 (10-15)	0.8-1.2 (20-30)	1.2-1.8 (30-46)	2.0-3.0 (51-76)	2.8-4.2 (71-107)	4.0-6.0 (102-152)
45° to vertical	0.2-0.3 (5-8)	0.4-0.6 (10-15)	0.6-0.9 (15-23)	1.0-1.5 (25-38)	1.4-2.1 (36-53)	2.0-3.0 (51-76)

ARRANGEMENTS

Fig. 11. Satisfactory arrangement for drives with short centers.

Fig. 12. It is best to have one shaft adjustable, as shown directly above, or use a chain tightener, as shown in lower arrangement.

Fig. 13. When the slack side is on top, some means must be provided to adjust the slack-side tension.

Fig. 14. Satisfactory arrangement for drives with short centers.

Fig. 15. When the slack side is on top, some means must be provided to adjust the slack-side tension.

Fig. 16. The best arrangement for vertical drives where means for adjusting slack is possible.

Fig. 17. This arrangement, while sometimes used, is not as satisfactory as that shown above.

Fig. 18. Unsatisfactory arrangement (no adjustment is provided).

LUBRICATION

One of the most important factors in getting the best possible performance out of your roller chain is proper lubrication. Each joint in a roller chain is a journal bearing, so it is essential that it receives an adequate amount of proper lubricant to achieve maximum wear life. No matter how well a transmission system is designed, if it is not properly lubricated, it's service life will be shortened.

Wear between the pin and bushing causes the roller chain to elongate. These parts should, therefore, be well lubricated. The gap between the pin link plate and the roller link plate on the slack side of the chain should be filled with oil. This oil forms a film that reduces wear on the pin and bushing, thus increasing the chain's service life. It also reduces noise and acts as a coolant when the chain runs at high speeds.

SUGGESTED LUBRICANTS

Only high-quality oil should be used to lubricate the roller chain. Neither heavy oil nor grease is suitable. The viscosity of the oil used will depend on the chain size, chain speed and ambient temperature. The lubricants suggested for specific temperature ranges are given in the table to the right.

The number of supply holes should equal Z+1 where Z is the number of strands of chain. The amount of oil supplied to each hole is constant.

Regardless of the lubricating system used, the roller chain must be cleaned periodically. Examine the pin and bushing after removing the chain. Any damage or reddish-brown color on their surfaces could indicate that the system is not being adequately lubricated.

Fig. 19. Chain lubrication.

TABLE 69. TEMPERATURE AND LUBRICATION

Temperature Degree °F (°C)	Suggested Lubricant
-20 – +20 (-29 to -7)	SAE 10
20 – 40 (-7 to 5)	SAE 20
40 – 100 (5 to 38)	SAE 30
100 – 120 (38 to 49)	SAE 40
120 – 140 (49 to 60)	SAE 50

TABLE 70. SPEED AND LUBRICATION

Chain Speed	Chain Number			
	60 and under	80 – 100	120 – 140	160 and over
ft/min. M/min.	gal./min. liter/min.	gal./min. liter/min.	gal./min. liter/min.	gal./min. liter/min.
1,600 ~ 2,600 490 ~ 800	0.26 1.0	0.40 1.5	0.53 2.0	0.66 2.5
2,600 ~ 3,600 800 ~ 1,100	0.53 2.0	0.66 2.5	0.79 3.0	0.92 3.5
3,600 ~ 4,600 1,100 ~ 1,400	0.79 3.0	0.92 3.5	1.06 4.0	1.19 4.5

LUBRICATION SYSTEMS

We recommend one of the following five lubricating systems:

MANUAL LUBRICATION

Oil is applied with an oil filler or brush in the gap between the pin link and roller link on the slack side of the chain. It should be applied about every eight hours or as often as necessary to prevent the bearing area of the chain from becoming dry.

Fig. 20.
Manual lubrication.

DRIP LUBRICATION

Use a simple casing. The oil is supplied by drip feed. Each strand of chain should ordinarily receive five to 20 drops of oil per minute, according to increases in the chain speed.

Fig. 21.
Drip lubrication.

⚠ WARNING

Failure to observe the following warnings could create a risk of death or serious injury.

Follow your lock-out tag-out and power off procedures before lubricating or servicing a chain system.

OIL BATH LUBRICATION

Use a leak-proof casing. The chain dips into the oil at the bottom of the casing. The sprocket should dip into the oil approximately $\frac{1}{2}$ in. If the sprocket is immersed more than $\frac{1}{2}$ in., too much heat is generated.

Fig. 22. Oil bath lubrication.

LUBRICATION BY SLINGER DISC

Use a leak-proof casing. The chain does not need to dip into the oil at the bottom of the casing. The slinger disc should dip into the oil from $\frac{1}{2}$ in. to 1 in.

Fig. 23. Lubrication
by slinger disc.

LUBRICATION USING A PUMP

Use a leak-free casing. A pump is used to circulate the oil, which is then cooled. See table 70 on page 56 for lubrication supply holes.

Fig. 24. Lubrication using a pump.

TROUBLESHOOTING GUIDE

TABLE 71. TROUBLESHOOTING GUIDE FOR CHAIN

Problem	Possible Causes	What to Do
Excessive noise	• Misalignment of sprockets • Loose casings or bearings • Too little or too much slack • Chain and/or sprocket wear • Inadequate lubrication or no lubrication • Chain pitch size too large	• Realign sprockets and shafts • Tighten set-bolts • Adjust centers or idler take-up • Replace chain and/or sprocket • Lubricate properly • Check chain drive selection
Chain vibration	• Resonance to the vibration cycle of machine to be installed • High load fluctuation	• Change vibration cycle of chain or machine • Use torque converter or fluid coupling
Wear on inside of link plate and one side of sprocket teeth.	• Misalignment	• Realign sprockets and shafts
Chain climbs sprockets	• Excessive chain wear • Excessive chain slack • Heavy overload	• Replace chain • Adjust centers or idler take-up • Reduce load or install stronger chain
Broken pins, bushings or rollers	• Chain speed is too high for pitch and sprocket size • Heavy shock or suddenly applied loads • Material build-up in sprocket tooth pockets • Inadequate lubrication • Chain or sprocket corrosion	• Use shorter pitch chain or install larger diameter sprockets • Reduce shock load or install stronger chain • Remove material build-up or install side-gashed sprockets (mud relief) • Lubricate properly • Install anti-corrosive chain or sprockets
Chain clings to sprocket	• Center distance too long or high load fluctuation • Excessive chain slack • Excessive chain wear	• Adjust the center distance or install idler take-up • Replace chain
Chain gets stiff	• Misalignment • Inadequate lubrication • Corrosion • Excessive load • Material build-up in chain joint • Peening of link plate edges	• Realign sprockets and shafts • Lubricate properly • Replace with anti-corrosive chain • Reduce load or replace with chain of suitable strength • Shield drive from foreign matter • Check for chain interference
Breakage of link plate	• Subjected to shock load • Vibration • Moment of load inertia is too large	• Reduce shock (e.g., install a shock absorber) • Install a device to absorb vibration (e.g., tensioner idler wheel) • Chain section should be checked (increase number of strands or select next larger size chain)

CHAIN TOOLS

EZ BREAKER®

CUT YOUR CHAIN BREAKING JOBS DOWN TO SIZE

EZ BREAKER® is a compact, easy-to-use tool for cutting roller chain. This simple, rugged piece of equipment can stand up to the abuses of the shop, farm or industrial environment.

EZ BREAKER will cut ANSI roller chain sizes 35 through 100H, 40-2 through 80-2, 2040 through 2060H, and 550 through 557 with a simple pull of the handle. No more grinding off pin heads. No more hammers and punches.

EZ BREAKER uses powerful cam action to push both chain pins through the link plates with an easy pull of the handle. Breaking different chain sizes is easy.

Precision die sets for each chain size are easily interchangeable. Changing from one die set to another can be accomplished in a few seconds. The time-consuming, tedious job of breaking chain is now accomplished with a single pull of the handle. EZ BREAKER links price and value.

EZ BREAKER has interchangeable die sets that make it easy to switch from one size chain to another.

Fig. 25. EZ BREAKER®.

Fig. 26. Chain breakers.

EZ CHAIN WEAR GAUGE®

Accurately checks up to nine sizes of American Standard roller chain and up to seven sizes of British Standard roller chain. Quick and easy to use, the go or no-go gauge system gives immediate feedback. Gauge will fit into limited spaces and quickly lets the user know if the chain is worn out.

- Precision-ground, pre-hardened tool steel.
- Convenient grip handle with pre-drilled holes for hanging, to keep you organized.
- Available in three chain gauge sizes:
 - #35 chain – #100 chain = UPC #0642051606376
 - #06B chain – #24B chain = UPC #0642051619048
(Actual gauge dimensions:
8.75 in. L x 0.625 in. W x 0.188 in. H)
 - #80 chain – #240 chain = UPC #0642051606383
(Actual gauge dimensions:
18 in. L x 1.5 in. W x 0.250 in. H)
- Gauges are designed for 3 percent elongation.
 - Sprockets for roller chain are designed to accept up to 3 percent elongation.

Fig. 28. EZ CHAIN WEAR GAUGE®.

- Single chain size gauges are available upon request for applications which limit elongation other than chain and sprocket interaction.

EZ CHAIN RACK®

Using the EZ CHAIN RACK® is simple. Learn how, in three easy steps, you can make it easy to store and cut our brand of precision roller chain. The EZ CHAIN RACK is versatile, allowing four positions to hold 50-foot reels of chain.

- High-quality welded construction.
- Stand-alone base.
- 31 in. x 31 in. x 51 in. (rough dimensions).
- Individually clutched to prevent chain from uncoiling.
- Four stations.
- Will hold two 50-foot reels of #40 or #50 chain per station.
- OR holds one 50-foot reel of #60, #60H or #80 chain per station.
- Allows easy switch from size to size.
- Rotates in both directions.

Fig. 29.
EZ CHAIN RACK®.

WARNING

Failure to observe the following warnings could create a risk of death or serious injury.

Follow your lock-out tag-out and power off procedures before lubricating or servicing a chain system.

U.S. Patent Number D598, 307 and 7,654,149, D596,512 and D665492.

GLOSSARY

A

Angle of Flex: The total angle of chain joint articulation as a chain enters or leaves a sprocket or wheel. The angle is equal to 360 degrees divided by the number of teeth in the sprocket.

ANSI/ASME: The abbreviation for “American National Standards Institute” and “American Society of Mechanical Engineers” – the organizations that sets the standards by which chains should be manufactured.

API: American Petroleum Institute and represents all aspects of the US petroleum and natural gas industry.

API 7F: American Petroleum Institute chain standard.

Articulation (v, “Articulate”): The action of a chain joint flexing from straight, to an angle and back to straight as the joint enters and leaves the sprocket or other path, causing it to flex.

B

Backlash: Movement (if any) of the chain along the pitch line of the sprocket when the direction of chain travel is reversed.

Block Chain: An alternative name used by some manufacturers for bar-link chain or for certain styles of leaf chain.

Bottom Diameter: The diameter of a circle measured between one tooth gap and the opposite gap for a sprocket with even an number of teeth.

Bushing: Internal component in a roller chain that the pin articulates around and the roller rotates on.

C

Cable Chain: See Leaf Chain.

Caliper Diameter: The distance measured between one tooth gap and the nearest opposite gap for a sprocket with an odd number of teeth.

Caterpillar Drive Chain: Chain with pushers that is used to drive drop forged chain.

Center Distance: The distance between the centers of the shafts of a chain drive.

Chain Casing: An oil-retaining safety enclosure around a chain drive.

Chain Guard: An open guard of sheet metal, expanded metal or similar construction around a chain drive.

Chain Length: The actual chain length between the joint centers at each end of a taut chain strand. This distance is usually expressed in feet and/or inches or in pitches.

Chain Pitch (Nominal): The average distance between the joints (except for staggered pitch chain) of an assembled chain. In some cases, “joint,” as defined here, will be a center of flexure not specifically identified with individual parts of the chain.

Chain Pitch Elongation or Chain Elongation: Increase in measured length due to wear or excessive load. Normally expressed in percent of length.

Chain Take-up: A mechanical device that takes-up chain slack. This could be an idler sprocket or similar device mounted on an adjustable bracket to adjust the slack in a chain installation.

Chain Width: Defined somewhat differently for various chains, but usually the inside width of the chain between the roller link plates.

Chordal Effect (Chordal Action): The effect produced by the chain joint centers being forced to follow arcs instead of chords of the sprocket pitch circle.

Clevis Connector: A connector used to connect a strand of leaf chain that has an inner-link end to a clevis block that has an inner-link configuration.

Clevis Pin: A pin used to connect a strand of leaf chain that has an inner link end to a clevis block that has an outer-link configuration. The clevis manufacturer should supply this part to help ensure that it will be compatible with the clevis block.

Compressive Stresses: Stresses that act to compress a material and place the material in compression.

Connecting Link: For a roller chain, a pin link made with one link plate that is easily detachable to facilitate connecting or disconnecting the chain.

Cotter Key: The retaining pin for a connecting link.

Creep: The flow of plastic deformation of metals held for long periods of time at stresses lower than the normal yield strength. The effect is particularly important if the temperature of stressing is in the vicinity of the re-crystallization temperature of the metal.

Crescent Chain: Standard chain with a crescent-shaped top plate.

Curve Chain: Chain designed to bend around curves in the horizontal position.

Cycle: Change in load level as a chain completes a cycle around a system. Usually the change is from negligible load to a load peak on a regular basis as the chain undergoes a complete operation cycle.

D

Deep Link Conveyor Chain: Chain design with a carrier roller that protrudes down below the side bar but does not protrude above the side bar.

Design Horsepower: The specified horsepower for a chain drive multiplied by a service factor. It is the value used to select the chain size for the drive.

Double-Pitch Roller Chain: A roller chain having double the pitch of a standard roller chain, but otherwise having standard pins and bushings, and standard or over-size rollers.

Duplex Roller Chain: Double strand chain (80-2) (double strand).

E

Elastic Limit: The highest load a part (e.g. chain strand) can sustain without incurring a permanent change in length.

Embrittlement: Reduction in ductility of materials due to exposure to certain environments or temperatures.

F

Fatigue Strength: Fatigue is the phenomenon leading to fracture under repeated fluctuating stresses having a maximum value less than the yield strength of material. Fatigue strength is the maximum stress that can be sustained for a specified number of cycles (10^7) without failure.

G

Galling: A condition on the load-bearing surface of a pin or bushing of a chain where excessive friction between high spots results in localized welding with subsequent tearing and a further roughening of the contact surfaces.

Gap Tooth Sprocket: An even-number tooth sprocket designed with clearance for a through rod or saddle. D-5 or GK1 attachment chains are used on this style sprocket.

H

Hardness: Chain hardness is typically measured in Vickers, Brinell or Rockwell.

Hoist Chain: Chain manufactured strictly for a lifting application.

Hollow Pin Roller Chain: Chain manufactured using a bushing as the pin holding the pin link plates. This chain is generally used in pairs with the two strands running parallel and a through rod tying them together.

J

Joining Link: See Connecting Link.

L

Leaf Chain: A chain consisting of interlacing side plates and riveted pins. This chain is manufactured in accordance with ANSI/ASME standard B29.8. This chain is typically used in lifting and/or tensioning applications.

Length Tolerance: The length new chain must be within when measured under a given load.

Link Plate: One of the side plates of either a pin link or a roller link in a roller chain.

Load Classification: A classification of drive loads based on the intensity of shock that is imposed on the drive.

Loading Frequency (Time): Loading frequency is the number of times per unit of time that the chain is exposed to a complete cycle of loading. A complete loading cycle normally occurs when a particular link moves completely around the system and returns to its starting point.

M

Master Link: See Connecting Link.

Matching and Tagging: When chains are required for multiple-strand

operation, it is important to specify to

the manufacturer “matched and tagged chain” together with the number of strands required. The chains will then be measured at the factory and a number tag attached to each strand.

Each matching group of strands is tagged with the same number and, whenever possible, will be wired and shipped together. The tags should not be removed until the chain is assembled.

The strands must be coupled so that those with the same number are installed side by side. All standard chains must meet standard length tolerances. Matching chain strands ensures that sections of chain with lengths at opposite ends of the tolerance range are not placed together in the conveyor.

Maximum Allowable Load: The maximum tension a chain may safely be subjected to. This value should never be exceeded by actual design load factored by speed, temperature, and dynamic adjustments as applicable.

Measuring Load: The specified standard load under which a chain is to be measured for length (1 percent of tensile strength).

Number of Roller Chain Strands	Multiple Strand Factor
2	1.7
3	2.5
4	3.3
5	3.9
6	4.6

Multiple-Strand Chain: In multiple strand, two or more chains are assembled side by side on common pins that maintain the alignment of the rollers in the several strands.

In multiple strands, center plates are located between the strands of roller links. Center plates may be slip-fit or press-fit on the pin as agreed between the chain manufacturer and user. The hyphenated number suffix in the chain number denotes the number of strands: 2 a double strand; 3 a triple strand; 4 a quadruple strand chain; etc.

Multiple Strand Factor: A factor by which the horsepower rating of a single-strand chain is multiplied to obtain the horsepower capacity of a chain with two or more strands.

O

Offset Link: A special offset link, as termed in roller chain descriptions, made for use in straight link chain when an uneven number of links in the total strand is required.

Offset Section: For a roller chain, a factory-assembled section, made up of a roller link and an offset link. Offset sections are used to connect strands of chain having an odd number of pitches.

Overchaining: A drive is overchained when it incorporates a chain of substantially higher rating than that indicated by normal selection procedures to have been necessary.

P

Pin Oven Chain: A chain used to convey cans through a drying oven. Typically 60 chain with an extended pin every 7th pitch is used.

Pitch: See Chain Pitch; Pitch Diameter.

Pitch Diameter: The diameter of the sprocket pitch circle.

Press Fit: Standard designed interference fit between side-plate pitch hole and pin/bushing.

Prestressing (Dynamic): Dynamic prestressing is the process of subjecting chain to a load as it is articulated or wrapped around multiple sprockets. Dynamic prestressing is done to seat the chain components and to reduce initial (break-in) elongation in chain drives.

Prestressing (Static): Static prestressing is the process of subjecting chain to a load at a minimum of 20 percent of the ultimate strength. The chain is pulled in a straight line. Static prestressing is done to seat the chain components and to minimize the variation in strand lengths of attachment chain used in pairs.

Pulsation: Fluctuations of a cyclic nature in load or speed (See Chordal Action).

R

Rollers: The component on the chain which engages the sprocket. The roller allows the chain to roll into the sprocket. The roller rotates on the bushing.

Root Diameter: The theoretical bottom diameter of a sprocket, equal to the pitch diameter minus the chain roller or barrel diameter (See Bottom Diameter).

Run-In: The initial period of operation of any mechanism, during which the component parts seat themselves.

S

Scoring: Marring or scratching of a pin or bushing caused by metallic debris being picked up in the contact surfaces on one of the parts.

Seating Curve: A specific term for the pocket curve of a roller chain sprocket.

Seizing: Stiffening (or freezing) of a chain joint as a result of roughness and high friction caused by galling. This occurs between the pin and bushing and/or link plates.

Semi-Press Fit (Tap Fit): Minimum interference fit between side plate and pin.

Service Factor: A factor by which the specified horsepower or working load of a chain is multiplied to compensate for operating conditions.

Sheave: A grooved wheel or pulley. Typically used with leaf chain to change its direction.

Shot Peening: Process which is used on the side plates to improve fatigue strength.

Sidebar: Another name for Link Plate.

Side Bow Chain: See Curve Chain.

Simplex Roller Chain: Single-strand chain (80) (single strand).

Sinter Bushing: Bushing made from powdered metal and then oil impregnated.

Skip Tooth: A sprocket designed such that the chain engages only every other tooth on the sprocket. Typically used with staggered pitch chain.

Slip-Fit: No interference fit between side plate and pin.

Slip Stick: Slip stick occurs when the motor drives continually and the sprocket rotates, but the chain moves ahead by stopping and starting at intervals. This could be caused by the following:

- Fluctuations in the coefficient of friction between bushing and rollers (i.e. rotating, sticking, rotating, sticking).
- Insufficient chain hardness on conveyor lines.
- Insufficient drive equipment or frame hardness.

Special Hook Cotter: The retaining pin for cotter-style chain and connecting links.

Staggered Pitch Chain: A chain with alternate links of differing pitches, one usually being considerably greater than the other.

T

Tensile Strength: See Ultimate Strength.

Tension Linkage: A chain application primarily transmitting motion back and forth or up and down at low speeds. A typical example is a forklift reciprocating system.

T-Pin/T-Head: The retaining pin for cotter-style chain and connecting links.

Tight Joint or Stiff Joint: Chain joint that does not articulate freely.

Top Roller Chain: Chain which has a roller on top to allow for accumulation of product on top of chain while the chain is moving.

Torque: Torsional force, expressed in inch-pounds in chain calculations, which is the product of chain pull and one-half the sprocket pitch diameter.

Transverse Clearance: Clearance between roller link plate and pin link plate.

Transverse Pitch: The lateral distance between the centerlines of each strand of multiple strand chain, or between the tooth profiles on a sprocket for a multiple strand chain.

Triplex Roller Chain: Triple strand chain (80-3) (triple strand).

U

Ultimate Strength: The ultimate strength of a chain is the single maximum load that breaks the chain. Typically specified as either average or minimum.

Underchaining: A drive is underchained when it incorporates a chain of substantially lower rating than that indicated to be needed from normal selection procedures.

W

Working Load: An allowable suggested chain load used on conveyors, drives with nonstandard chains, or other applications of lower relative speed.

Wrench Chain: Wrench chains are leaf chains with pins extending beyond both sides of the chain. It serves as a tension linkage for holding pipe securely in pipe wrenches. The extended pins permit this chain to support a load not in line with the chain without danger of pulling the link plates off the pins. The pins are used to lock onto a mechanism to accommodate various pipe sizes.

Y

Yield Strength: The elastic limit or yield strength of a chain is the load that causes permanent elongation of the chain.

This page is intentionally left blank.

**PRECISION
ROLLER CHAIN
PRODUCT CHARTS**

Our precision roller chain products are manufactured to meet or exceed ANSI standards. They excel in tough, high-performance applications. We can even custom manufacture product to your specifications.

Carbon Steel	72
Heavy Series Roller Chain Products	86
Oil Field Roller Chain	90
Reduced Maintenance Chain	100
Corrosion Resistant Chain	102
Specialty Chain	107

PRECISION ROLLER CHAIN PRODUCT CHARTS CARBON STEEL

- Cut-to-length chain available.
- Chain size 80 and larger supplied with cottered connection links.

160 – 2.000 IN. PITCH

- Cut-to-length chain available.
- Multiple strand 160-3 through 160-8 only available with through-hardened pin in riveted and cottered styles.

NOTE: 35, 41, 40 and 50 are riveted only, 60 - 240 are available in riveted and cottered.

HEAVY SERIES ROLLER CHAIN PRODUCTS

HR RIVETED SERIES CHAIN

Case-hardened Pins

- Additional multiple-strand widths available upon request.
- Cut-to-length chain available.
- 60H slip-fit spring clip connector standard. Cotter available upon request.
- 80H – 120H slip-fit, hook-style cotter connecting link standard. Press-fit available upon request.
- Other multiple-wide sizes available.
- Cotter style available upon request.

Z AND HZ RIVETED AND COTTERED SERIES CHAINS

Through-hardened Pins

Z and HZ series chain features include:

- Through-hardened pins are used for higher working load capacity and additional resistance to fatigue in heavy load application.
- Ballized pin-plate, middle-bar and bushing-plate holes made to precision tolerances provide increased bearing area and press fits, improving fatigue life and working loads.
- Wide-waisted link plates are manufactured with maximized ball height from special alloy steels for added strength. The wide link plate profile improves stress distribution, leading to improved fatigue resistance and enhanced performance.
- Riveted endless construction standard/suggested for certain applications.

Z and HZ series chain has the same dimensions as ANSI-standard heavy series chain.

- Additional multiple-strand widths available upon request.
- Size 264 chain is produced with a heavy series side plate (0.375 in. thick plate material) and a larger diameter pin, which provides greater bearing area and improved wear life. 264 chain will fit on the same sprockets as 200H.
- Please consult your Drives representative for maximum allowable loads.

OIL FIELD ROLLER CHAIN PRODUCTS FEATURES AND BENEFITS FATIGUE/WEAR

ALL BALLIZED PLATES

Ballized pin-plate, middle-bar and bushing-plate holes made to precision tolerances provide increased bearing area and press fits, improving fatigue life and working loads.

Fig. 30.
All ballized plates.

WIDE-WAISTED LINK PLATES

Wide-waisted link plates are manufactured with maximized ball heights from special alloy steels for added strength. The wide link plate profile improves stress distribution, leading to improved fatigue resistance and enhanced performance.

Fig. 31.
Wide-waisted link plates.

THROUGH-HARDENED SHOT PEENED PINS

Through-hardened pins are hardened and shot peened, designed to provide maximum performance in demanding applications. These pins increase the fatigue strength of the chain for protection from unpredictable overloads.

Fig. 32.
Through-hardened shot peened pins.

SPECIAL HOOK COTTER

A full-hardened hook cotter provides greater link-plate support and up to twice the shear strength of conventional short split cotters. The easily installed hardened hook cotter is designed to retain position in high-vibration applications.

Fig. 33. Special hook cotter.

COATED T-PIN

High-shear T-pins are designed to resist corrosion and retain position in the most extreme applications. Sizes 200, 264 and 240.

Fig. 34. Coated T-pin.

SOLID BUSHINGS

Designed for increased wear life.

SOLID ROLLERS

The solid roller allows for smooth rotation on the bushing, reducing the impact load as the chain engages the sprocket tooth.

FACTORY PRELOADED AT 50 PERCENT MUTS

Our chain is preloaded to 50 percent of minimum ultimate tensile strength (MUTS), which is especially important for applications involving fixed center-to-center sprockets without take-ups. Applications can withstand shock loads up to 50 percent of the chain's MUTS without premature elongation.

PRELUBRICATION

After final assembly, we hot-dip roller chain in a special lubricant. This process ensures that all the load-bearing surfaces are initially protected from metal-to-metal contact, improving the wear life of the chain.

NOTE: We suggest changing out the sprockets each time the chain is replaced.

PREMIUM OIL FIELD ROLLER CHAIN PRODUCTS

Typical chain locations on an oil rig

TABLE 91. DRIVES CHAIN TABLE

Chain Drive	Rig Horsepower (Kilowatt)						
	4000 (2983)	3000 (2237)	2000 (1491)	1500 (1119)	1000 (746)	750 (559)	500 (373)

NOTE: Size 264 roller chain provides greater tensile strength/working load and replaces 200H chain.

OIL FIELD ROLLER CHAIN PRODUCT SPECIFICATIONS

80Z-1 THROUGH 240Z-1

- Cut-to-length chain available.
- Corrosion resistant finishes for components available upon request.
- Offsets not suggested. Please contact your Drives representative.
- T-pin cotters used on sizes 200, 264, and 240 oil field chain.
- Heavy-chain series available/MT0.
- 121 series replaces 472 series.
- Size 264 chain provides greater tensile strength/working load utilizing larger diameter pin and replaces 200H chain.

NOTE: Dimensions are subject to change. Contact your Drives representative to obtain certified prints for design and construction.

NOTE: Oil field chain is always cottered.

HEAVY SERIES OIL FIELD ROLLER CHAIN PRODUCTS

- Connecting link available in cottered/press fit or slip fit.
- Please consult Drives engineering for maximum allowable loads.
- Size 264 chain is produced with a heavy series side plate (0.375 in. thick plate material) and a larger diameter pin, which provides greater bearing area and improved wear life. 264 chain will fit on the same sprockets as 200H.

POWER TONG CHAIN

Power tongs are used to spin and tighten drill pipe, casing, tubing or other types of pipe. In some instances they also are used to apply the final makeup torque. The chain used on the power tongs is designed to grip the pipe. We supply individual boxes of power tong chains that are cut to the specified length required for the power tong you have. Please contact your Drives representative for availability of your power tong chain.

COIL TUBING INJECTOR CHAIN

As chain interacts with the injector sprockets, positioned gripper blocks secure the tubing to advance or retract the coil within the well. Special chain pins manufactured from alloy steel are through-hardened for ductility and fatigue resistance. Use Drives coil tubing injector chain kits with OEM Carrier/Gripper blocks. Contact Drives for additional kits.

Coil Tubing Injector Chain to Fit OEM Gripper Blocks

Primary oil field chain features include:

- All ballized plates.
- Wide-waisted link plates.
- Through-hardened shot peened pins
- Special hook cotter.
- Coated T-pin.

NOTES _____

Use this form to identify the chain and attachments you need. If you have any questions, please contact Drives engineering at chain@timken.com.

Note:

1. Semi press-fit plates are available on chain sizes 160, 180 and 200.
2. Hook cotters will be supplied on chain sizes 120-180.
3. T-pins will be supplied on chain sizes 200 and 240.

ADDITIONAL INFORMATION _____

REDUCED MAINTENANCE CHAIN

EXTENDED LIFE CHP® SERIES CHAIN

- Directly interchangeable with standard ANSI chain.
- Outstanding wear and shock-load performance, even at elevated temperatures.
- No reduction in working loads or operating speeds.
- Exceptional pin wear resistance reduces chain elongation and can increase wear life up to three times more than conventional premium chains (fig. 36).
- Full range of ANSI standard attachments available.
- Extended Life CHP offsets available on a made-to-order basis. Two pitch riveted offsets are required.
- Cotter-type connecting links standard for Extended Life CHP® chain.
 - 40 through 60 pitch dual cotter key.
 - 80 through 180 pitch hardened hook cotter.
 - 200 through 240 pitch coated T-pin.
- Available in single- and double-strand sizes – #40 to #240.
- Riveted or cottered pins available depending on size.
- Corrosion resistant finishes available upon request for side bars, bushings and rollers.
- We suggest operating roller chain with periodic lubrication and maintenance. Various lubricants are available, including food grade and no-stain, depending on application.
- **Extended Life CHP also can be applied to carbon steel heavy series chain and other specialty chains, silver shield, stainless steel and engineered class chain. Please consult with your Drives representative.**
- Chain is available with:
 - Hot dip lubricant (CD) for optimal chain wear life.
 - Rust inhibitor (CH) for those customers who do not require hot dip lubricant.

DRIVES ELEMENT® CHAIN

Drives Element® chain combines the latest roller chain technology for superior performance and convenience in difficult environments. Roller chains operate best when effectively lubricated. However, the reality is that regular lubrication is not possible or practical for every application. To solve this issue, Drives Element has been carefully constructed with three main components:

- Lubricant-infused bushing gives supplemental lubrication to the pin/bushing joint.
- Extended Life CHP® pins provide a smooth, hard pin surface for exceptional wear performance.
- Silver Shield CR® coating provides added corrosion resistance.

TABLE 96. DRIVES ELEMENT® CHAIN DIMENSIONS

Chain No.	Pitch P	Min. Roller Link Inside Width W	Roller Diameter D	Average Weight

Fig. 36. Accelerated wear test of Drives Element® vs. a competitor.

Accelerated wear test conditions: ANSI 60 chain, 275 RPMs, 230 lbs. (1023N) tension, 3.0 chain horsepower (2.24 kW), 23T x 23T sprockets.

CORROSION RESISTANT CHAINS

If your power-transmission or conveyor-chain application requires resistance to moisture, mild or aggressive corrosive agents, or extreme temperatures, look to us for the corrosion resistant chain products that best fit your needs. The chain you receive will help provide the dependability, reliability and productivity that makes us a leader in the production of power transmission and conveyor chains.

NICKEL-PLATED CHAIN

Nickel-plated chain is designed to resist incidental contact or exposure to water or water-based washdown operations. We apply an electroless nickel plating to the component parts prior to assembly to provide initial coverage of all exposed carbon material. Special attention is placed on the after-plating processes to help remove the possibility of hydrogen embrittlement – a common occurrence in lesser-quality chain.

SILVER SHIELD CR® CHAIN

Silver Shield CR® chain is available for applications that may be subjected to mildly caustic or acidic environments. Silver Shield CR® chain consist of our standard carbon steel components, specially coated with a zinc-aluminum compound. This compound, combined with a polymer-based resin, tightly adheres to the components during a high-temperature baking process. This combination-quality carbon steel components and environmental-resistant coating – provides one of the best alternatives to stainless in applications where stainless has historically been the only option.

600 AS SERIES STAINLESS STEEL CHAIN

The primary use of 600 AS series stainless steel chain is in corrosive and/or high-temperature environments, which shorten the life of a standard carbon steel chain. The hardened round parts provide up to a 50 percent higher working load and better wear life than 304 PS series stainless steel chain. This chain is designed for drive applications that normally have a high number of articulations.

304 PS SERIES STAINLESS STEEL CHAIN

The primary use of 304 PS series stainless steel chain is in corrosive and/or high-temperature environments, which shorten the life of standard carbon steel roller chain. The 304 PS series stainless steel chain provides excellent resistance to corrosion and high temperatures. 304 PS series stainless steel is generally considered non-magnetic.

316 NS SERIES STAINLESS STEEL CHAIN

The primary use of 316 NS series stainless steel chain is in highly corrosive and/or extreme-temperature environments which shorten the life of 304 PS series stainless steel chain.

CAUTION

Failure to follow these cautions may result in property damage.

Do not weld or torch-cut nickel plated or Silver Shield CR® coated chains. Consult your Drives representative for application information.

SELECTION INFORMATION

We offer stainless, Silver Shield CR and nickel-plated (NP) materials and coatings in commonly used sizes. They're available in standard packaged lengths or cut-to-length as required. Additionally, attachment link plates and extended pins are readily available for the most commonly requested ANSI power-transmission and extended pitch conveyor chains. Contact your Drives representative for the specific availability of the size and configuration your application requires.

The overall application requirements are important when selecting the correct type of roller or conveyor chain. The factors that most often define what chain combination should be used are resistance to the environment, wear life/strength and total operational cost.

The following are some characteristics to consider when selecting the chain that best suits your application.

ENVIRONMENT RESISTANCE

The chain selected should be capable of resisting the majority of the chemical and/or temperature requirements. If it's an ambient-temperature environment, then you need to only address the chemical presence. Our stainless, nickel-plated or Silver Shield CR® chains may be considered depending upon the severity of the chemical environment. If the environment is one that is elevated or sub-zero, stainless steel chain will most often provide the best overall operation.

WEAR LIFE/STRENGTH

If satisfactory chain life is defined as extended wear, then carbon steel based products are best suited. Our nickel-plated or Silver Shield CR® chains are constructed from carbon steel components that have the highest level of wear resistance and strength.

Chain strength is normally defined by its allowable working load. This value is one at which the chain can be expected to operate at or below for an indefinite period of time. Remember, allowable working loads are significantly less than ultimate tensile strength. Chains can have different allowable working loads but have similar ultimate tensile strengths.

COST

Cost normally depends on the material used to produce the chain. Stainless steel chain is considerably more costly to produce than carbon-based chain. However, if the environment requires a chain with exceptional corrosion resistance, a carbon steel based chain may provide the user with a lower-priced product, but may incur a higher cost of operation.

NICKEL-PLATED CHAIN

We produce nickel-plated chain to withstand the effects of exposure to moisture, outdoor conditions and incidental washdown applications. All components are identical to our carbon steel components with the addition of electroless nickel plating applied prior to assembly, which provides initial coverage of all exposed carbon material.

- Equal in strength and wear life to carbon steel chain.
- Electroless nickel-plated parts provide uniform and comprehensive protection.
- Resists rust from incidental exposure to water or water vapor.
- Nickel plating applied prior to assembly.

SILVER SHIELD CR® CHAIN

Many industry applications require a roller chain option that provides the strength of carbon steel combined with some degree of corrosion resistance. For this reason, we engineered Silver Shield CR. Silver Shield CR is constructed using our standard high-quality carbon components that have been specially coated using a zinc-aluminum compound. After coating, a protective polymer resin is applied and baked on to provide resistance to abrasion and flaking. Silver Shield CR is specifically designed to resist mild acidic or caustic environments.

- Equal in strength and wear resistance to carbon steel chain.
- Protective coating is applied to all parts for uniform and comprehensive protection.
- Silver Shield CR coating developed specifically for corrosion resistance in caustic or acidic environments.

WARNING

Failure to observe the following warnings could create a risk of death or serious injury.

Do not weld to Silver Shield CR® chain as it will release toxic fumes.

LEAF CHAIN

Drives leaf chain is designed and manufactured in accordance to ANSI standard B29.8.

- Alloy steel pins are through-hardened for ductility at low temperatures while maintaining hardness for wear life.
- Through-hardened plates with ballized holes are used for improved fatigue strength.
- When ordering, specify your requirements. Strands with an odd number of pitches, inner links at both ends will be provided as standard.

ATTACHMENT ROLLER CHAIN PRODUCT CHARTS

We deliver what customers need, when they need it, supplying attachment roller chains to get equipment running again.

We offer attachment roller chains in carbon steel, Extended Life CHP® series chain, Silver Shield CR, Silver Shield CR with Extended Life CHP pins, and stainless steel.

Our Drives representatives are available to help you select the right chain for your equipment.

TYPES OF ATTACHMENT ROLLER CHAINS

Drives attachment roller chains are available in carbon steel, Silver Shield CR® coating, Extended Life CHP®, Silver Shield CR® plus Extended Life CHP®, and stainless steel.

Fig. 37. Carbon steel attachment selection.

CHAIN CONFIGURATOR

The Diamond-Drives Chain Configurator is a state-of-the-art configurator which allows customers to build a custom chain within a full 3D window. Chains can then be downloaded into any 3D format needed or published to a PDF to allow for simple ordering with customer service. Start building a custom chain today: <https://chain.timken.com/>

Chain Size ————— **60-1 R AS BK1-4P 140 N A A** ————— **Type of Capping Plate**

Strand Width —————

R: Riveted —————

C: Cottered —————

Type of Attachment
(see page 114)

Blank: Carbon Steel

CR: Silver Shield CR® (see page 105)

NP: Nickel Plated (see page 104)

CH: Extended Life CHP® with Rust Inhibitor (see page 100)

CD: Extended Life CHP® with Hot Dip Lube (see page 100)

CC: Silver Shield CR® with Extended Life CHP® Pins (see page 105)

AS: 600 Stainless Steel (see page 106)

Attachment Spacing

Strand Length

- Strand Length in Pitches
- 10FT - 10' Box
- 50FT - 50' Reel
- 100FT - 100' Reel

Type of Connector

- **A** - Spring Clip
- **C** - Split Cotter
- **R** - Riveted

Offset Link

- **N** - No Offset
- **R** - Riveted Offset Link
- **D** - D Style Offset Link

**ENGINEERED
CLASS**

Engineered Class chain is designed for your industries and unique applications. Drives Engineers work with customers on chain selections for new applications and evaluating existing applications to determine if there is a way to increase up time.

Drives state of art component and assembly tooling in junction within house heat treatment provides for high quality Engineered Class Chain designed to provide for increased up time.

All high quality chains must start with material selected and Drives uses alloy steel and appropriate heat treatment specifications for the components which will optimize the performance of our Engineered Class chain in these demanding applications.

ENGINEERED CLASS CHAIN – GENERAL

CARBON STEEL ROLLER CONVEYOR CHAIN

Carbon steel roller chain is designed with a free-rotating roller for conveyor applications.

STAINLESS STEEL ROLLER CONVEYOR CHAIN

Direct contact with food, corrosive environments and extreme temperature requires stainless steel chains. Drives has the engineering expertise to select the correct stainless material and chain construction for your application. The following chains are just a sample of some of the stainless steel Engineered Class chain that we manufacture.

CARBON STEEL BUSHED CONVEYOR CHAIN

Carbon steel bushed conveyor chains are designed without a free- rotating roller for applications in which the chain will be exposed to an environment that would cause a roller conveyor chain's roller to seize or in applications that are such a roller has no advantage like in bucket elevators.

All high-quality chains must start with material selected and Drives uses alloy steel and appropriate heat treatment specifications for the components which will optimize the performance of our Engineered Class chain in these demanding applications.

BAR AND PIN CHAIN

Bar and Pin chain are used in a variety of applications, from conveyors like stacker reclaimers to tensioning linkages. These chains are manufactured with an inner block and two outer bars. They will have a pressed-in bushing into the inner block for improved wear life between the pin and inner block. In some cases the pins are induction-hardened for improved wear life. The edges of the inner block and outer bars can be induction-hardened for improved wear life since the chains are dragged on the guides.

ENGINEERED CLASS T BAR CHAIN

This chain is well-suited for conveyor operations where speeds are moderate and constant. Simplicity of design results in a rugged, uncomplicated chain that will work under most hostile conditions. Further, links may be replaced by hand to keep the chain in constant working order, or to shorten or lengthen the chain.

**ENGINEERED
CLASS CHAIN –
BY INDUSTRY**

Drives supplies Engineered Class chain to many different industries the following includes a sampling of those industries:

Automotive	136
Material Handling	137
Food Processing.....	141
Forest and Paper	145
Metal Processing.....	155
Mining	159
Sugar Mill	161
Agricultural	165

ENGINEERED CLASS CHAIN – BY INDUSTRY AUTOMOTIVE INDUSTRY

CATERPILLAR DRIVE CHAIN

Drives Caterpillar Drive Chain is essential in driving drop forged chain conveyors. It provides high fatigue life and is designed to perform flawlessly with forged rivetless chains.

Drives Caterpillar Drive Chain features all ballized plates to ensure maximum bearing area for optimum press fits. This improves fatigue life and working loads. We use wide waist link plates with maximized ball heights to improve stress distribution that also increases fatigue strength and reduces vibration.

The use of through-hardened pins that are micro ground and shotpeened provides maximum pin-to-bushing surface contact for extended wear and protection from unpredictable overload. Hardened hook cotters are used to resist shearing and hold their place in the most rigorous applications.

Our one-piece forged drive dog is induction-hardened in the chain contact bearing area for wear resistance. The balance of the drive dog is through-hardened for strength and durability. The entire assembly is designed to operate in combination with the drop forged rivetless chain.

Special hardened hook cotter key comes standard.

STACKER RECLAIMERS

Stacker reclaimers are used in heavy industrial processes that transfer large storage piles of bulk material. Reclaimer chain and flight assemblies function like scraper conveyors, with flight blades that push material toward a belt-feeding system. The reclaimer conveyor's chain, with digging flights, is supported by rails and structure that span over or across the pile being reclaimed for transfer to other plant locations.

Drives stacker chain features maximum bearing areas, high hardness and case depths made to provide optimum performance. Reclaimer chain is manufactured on a made-to-order basis with minimum order quantities. Contact Drives for additional information.

FOOD PROCESSING

Food processing is a large industry with subcategories, and each has special needs and requirements. Some carry heavy loads, some are subjected to high temperatures, and others endure frequent washdowns. Each requires reliable chain to move product quickly and efficiently. The types of chain vary, depending on the application.

FOOD PROCESSING

PROOFER CHAIN

Drives chain is made with high-temperature alloy steel. Component heat treatment and clearances are selected to improve wear life and minimize the risk of stiff joints. Consult Drives engineering for additional application information.

OVEN CHAIN

Drives oven chain is comprised of specially designed 300 series sidebars with 17-4PH (precipitation hardened) pin, bushing and roller. The combination of material, in conjunction with increased clearances, allows this chain to handle the high temperatures and corrosive environment of an oven.

FOREST AND PAPER

Drives produces industry leading Engineered Class conveyor chains for the forest and paper industry. These tough applications require chains that are built to the strictest quality standards ever established. Drives' advanced engineering knowledge and experience ensures maximum strength and performance while setting the standard for quality in this industry.

FOREST AND PAPER

81X CHAIN

- Manufactured with premium quality alloy steels.
- Heat treated and tempered for extended service life.

Solid Rollers

- Smoother engagement with sprockets.
- Rollers rotate freely reducing pulsation in conveyors.

Solid Bushings

- Drives' new computer controlled curling equipment provides a high quality concentric bushing.
- These bushings allow for minimum initial wear.

TABLE 135. 81X ROLLER CONVEYOR CHAIN

81X EXTENDED LIFE CHP® SERIES

Extended Life CHP® pins possess standard steel's metallurgical properties for toughness and strength while delivering an extremely hard wear-resistant pin surface. Extended Life CHP pins resist wear longer than standard heat-treated pins, even in dry and abrasive environments.

- The chain bushing has a baked on dry-film lubricant. This gives the chain joint a lubricating film in the bearing area.
- Outstanding wear and shock load performance at the same temperature ranges as standard carbon steel chain.
- No reduction in working loads or operating speeds.
- Exceptional pin wear resistance, in conjunction with the dry-film lubricant on the bushing, reduces chain elongation and can increase wear life up to three times over conventional premium chains under like conditions.

Fig. 38. Elongation vs. time.

81XH, 81XHH CHAIN**Heavier Sidebars**

- 23 percent more bearing surface for conveying product.
- Increased sidebar thickness on the roller link plate allows for welding to the inner link plate.

Through-Hardened Pins

- 20 percent higher tensile strength and resists bending under high shock loads.

Solid Rollers

- Smoother engagement with sprockets.
- Rollers rotate freely reducing pulsation in conveyors.

KILN DRYER SERIES CHAIN

Technical Specification/Performance

KD series chain is produced with the following features:

- Minimum twist in each direction is 4 degrees and the maximum difference in twist from one side to the other is 12 degrees.
- Minimum camber in each direction is 2 in. and the maximum difference in camber from one side to the other is 4 in.
- Special alloy pin material with nominal hardness at 45 HRc (provides strength in higher temperature operations and greater wear life performance) for wallboard/dryer applications.
- Alloy bushing material (provides strength, durability and wear life) for wallboard/dryer applications.
- Nominal lateral plate clearance at 0.06 in. (with increased pin length requirement) provides tolerance for heat expansion/contraction and accommodates for misalignment of the hangers. Delivers non-binding chain operations in higher temperatures/longer cycle wall board systems.
- KD series manufactured with increased clearance between sidebars to prevent stiff joints under elevated temperatures. Special rust inhibitors available.

Installation/ Service Factors

- J-style designed connectors can be specified for superior retention and service access.
- 25 ft. or 50 ft. coils available, on pallets/crates for efficient installation.
- No hassle, non-return reels available:
 - 200 foot for 81X or 81XKD
 - 125 foot for 81XH and 81XH KD
- Steel returnable reels available:
 - 600 foot for 81X or 81XKD
 - 500 foot for 81XH and 81XH KD

METAL PROCESSING

Extreme conditions within the metal processing industry demand chains that are designed to withstand the enormous weight of the materials being conveyed, high temperatures and the distance that the material must be conveyed.

SUGAR MILL

Sugar mills provide a rugged test for chains as they convey the cane through the refining process. Drives produces several chains for this challenging application, including roller conveyor chain, bagasse carrier chain, main cane carrier chain and drive chain. Drives chains are designed and engineered for top performance in the 24/7 demand of the harvest season. Drives uses a combination of carbon and alloy steels to achieve the optimum chain life and offers stainless steel, chrome plating, and nickel plating for specialized service.

SUGAR MILL

SUGAR MILL CHAIN

Drives chain components are heat treated in modern furnaces that are controlled by PLC (Programmable Logic Controllers) technology. Drives not only performs standard hardness tests,

but also bending and crush tests to ensure that all parts have the proper balance of strength and ductility. To achieve the proper press fits, Drives utilizes state-of-the-art manufacturing processes and in-house tooling designers to ensure round holes with maximum contact between mating surfaces. Drives precision assembly equipment is used to manufacture the chain with equal twist and camber so the chain will run straight and true. Drives' advanced quality assurance processes verify that the chains are equal to or exceed ANSI standards, assuring that you, our customers, have an industry leading chain available for your application.

STEEL PINTLE SPROCKET

PINTLE SPROCKET FEATURES

- Premium quality steel sprockets
- Made to ANSI specifications
- Design includes annular ring
- Design includes mud clearance
- Plain bore or keyway and two set screws
- Hubs are precision machined

ANNULAR RING AND MUD CLEARANCE

The annular ring contacts the bottom edge of the pintle chain link, relieving the chain barrel and sprocket tooth face of the chain load. This extends the service life of both the chain and the sprockets.

The mud clearance feature consists of narrowing the bottom diameter of the sprocket in between the tooth where it contacts the chain barrel. This allows debris to escape and prevents sprocket tooth build-up.
